

Mols-Linien has changed their Internet booking system from a Windows Server platform to IceBreak on an IBM System i™

Mols-Linien's internet booking system used a Windows Server for years. This communicated with a booking system on an IBM System i™.

It was a complicated solution. The introduction of every new feature required a big investment and a lot of coordination between many different suppliers.

Today, the Windows Server hosts only static information and pictures. The strategic business applications have all been moved to the safety of the System i™.

Mols-Linien view their online booking system as crucial to their business.

The application has to service hundreds of internet customers every day. And the data it delivers to the billing and ticket system has to be accurate. As the online booking system has grown in popularity, the number of staff has been adjusted accordingly. Now it is more essential than ever that the application is stable and reliable.

The booking and ticketing systems run on an IBM System i™. Mols-Linien spent a long time looking for a booking system that could minimize errors, simplify maintenance and optimize development. IceBreak has fulfilled their expectations.

Excel Data, the company which developed the cBooking booking and ticketing system, used IceBreak to move the system from a Windows Server to IBM System i™.

Mols-linien are happy. They now have a single solution from a single supplier on one platform.

"We used IceBreak to transfer our Internet Booking System from a .NET Windows Server to an IBM System i™ which is both reliable and secure. We have not experienced any significant strain on our IBM System i™ since we carried out the transfer."

Bent Rasmussen, Mols-Linien

It took Excel Data less than two months to complete the transfer.

Excel Data had already used IceBreak to relocate smaller System i™ applications. Drawing on this experience, they successfully transferred Mol-Linien's Internet Booking system to an IceBreak application in less than two months.

After a period of testing, they launched the system along with several new functions. All the strategic business applications have now been merged with the underlying systems to create a single stable, integrated solution.

Excel Data can now offer their customers an improved online booking system that is cheaper and better integrated with various administrative solutions on System i™. The success of the transfer was down to Excel Data's experience and the effective reuse of RPG programs.

"Using IceBreak gave us a big advantage. It meant we could reuse the RPG programs from our original Booking System. As a result, our design partners found it easy to import the existing HTML code and Style-sheets to achieve a consistent layout."

Tom Grønkjær Nielsen, Excel Data
