

InterForm

... The complete forms solution
With all the advantages

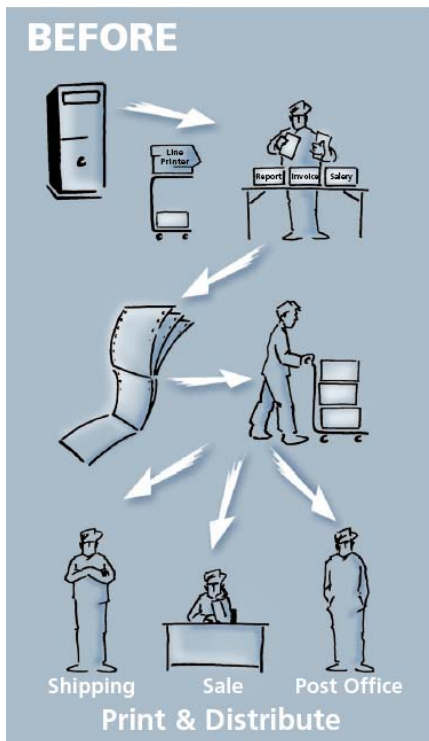

With InterForm, forms can be created and controlled so that all requirements are fulfilled

InterForm is a Danish designed software program for iSeries (IBM AS/400). Without any "boxes" or other external hardware or IBM software, InterForm gives your company the total freedom to design, store and print your own electronic forms

Further the product supports functions like sorting, split, combining etc. to make it easy to administer and control printouts.

InterForm can be installed without any changes in the Company's existing applications...

InterForm is implemented **without any changes** in your existing standard systems and can use an unlimited number of laser printers. InterForm is exclusively based on genuine AS/400 software and is, therefore, not depending on any hardware. This ensures that the solution can grow with an increased demand for electronic forms and a high stability as InterForm is not depending on possible malfunctions in external hardware.

Laser printers

InterForm supports all HP compatible laser printers and copy machines, which run PCL4, PCL5 or PCL5e.

Labels printers

Likewise InterForm supports all labels printers, which run using Zebra ZPL2-language. Also print speed, temperature, cutting and other functions are fully supported.

Integration to all applications...

InterForm includes a number of user-exits, which makes it possible to integrate the product to other applications.

InterForm controls all distribution, printing and overlay processes...

The built-in **AutoFormsControl** can control any form, once the print is ordered. This means that InterForm automatically can distribute forms to all laser printers within the company. E.g. when an invoice is printed, simultaneously shipping papers is printed in the shipping department, and an invoice copy is printed in the finance department – all with different layout and adjusted contents. This is all done in a single automated process completely transparent to the user.

... The possibilities are unlimited with InterForm

"InterForm has provided Bonnier Systems A/S with a flexible and cost-effective solution for handling the re-addressing of 60-70.000 mailings each month."

IT Manager Jan Olsen
Bonnier

"InterForm has brought cost-savings and increased efficiency. This has given a great response in the entire company"

Department Manager Peter Thomsen
Volvo, Denmark

"We are actually able to print out our invoices directly on our subsidiaries' laser printers in the various countries"

Systems Manager Stig Blicher Hansen
Modulex

Graphic Designer

Forms can be created directly in the graphic designer, which includes full support for graphic elements in TIFF and colour BMP – and text elements with individual TrueType fonts.

It is possible to create and work with attached sub-forms directly from the form. The designer can structure the way the form is build e.g. by handling the item lines in an attached sub-form, which gives a better overview.

With a drag and drop function, the data is reformatted into the final form. The well known Windows-functions like copying, moving, deleting and selecting more than one element is also supported.

All elements, which are used in the form can be conditioned, which means that the form changes dynamically depending on the contents of the print-out.

The forms design that is used for laser print can also be used for creating a PDF-document, including the possibility to add a colour image.

The graphic designer also supports creation of Zebra labels. When creating a label, the tools menu is automatically changed to include the special functions that are available on a label printer.

PDF Documents

In order to fulfil the high security requirements, which are determined in Danish and European law per January 1, 2004 regarding handling of electronic documents, InterForm is able to save, send, encrypt, password protect and digital sign PDF-document on a very high security level.

Further InterForm includes a file system, in which PDF-documents can be saved in automatic build hierarchic folder structures.

Bookmarks can make a search in large PDF-documenter more simple and fast. Bookmarks can be created in up to 6 levels, with a possibility to combine the lead texts with the print data and stationary text. It is also possible to decide on which level the PDF-document opens.

Spool Management

InterForm can be used to manage and control all types of printouts within the company. This means that many manual and time consuming work procedures concerning handling of printouts can be atomised or completely removed with InterForm.

On print-out can be **split** into many smaller printouts depending on the contents of the print-file. The split can be controlled by a number of conditions, which is connected with an and/or-logic. The conditions will often be based on the contents of the print-out, but can be supplemented by a database-lookup in a user-exit-program.

When using a user-exit-program, missing information in the print-out can be collected from the database and included in the print-out.

A split function can remove unwanted pages and in the same process distribute parts of the printout to various printers within the company. These printers can also be controlled by InterForm, making it possible to start new processes.

Based on contents the printout can be **sorted** in either ascending or descending order in up to 6 levels. If required it is possible to insert a separation page when level is changed.

If using the **combining** function in connection with the **sorting** function, it is possible to eliminate time consuming manual handling of the printout. InterForm can combine printouts like order confirmations, invoices, specifications and account statements per customer number and print these together per customer, separated by a blank page if required.

If one printer cannot handle the print job alone, the combined print file can be split between several printers. The combine function can be activated manually or it can be scheduled to run automatically on set times.

Reformatting opens the possibility to change radically in the way the printout is build and in the contents. The number of item lines per page can be changed and room can be made for a payment slip. In the same process the printout can be added any missing information e.g. add a location number to an item or build a OCR-line for the payment slip.

Envelopes and franking are supported and InterForm can include logo, sender address, franking marks etc. on the envelope. Other functions that are supported are number of pages per envelope, enclosures and sorting. Each print job is ended with a report stating number of envelopes in each franking group, and number of pages printed for manual handling etc.

Build in stapling machines can be dynamically activated by InterForm.

Control of **drawers** in the laser printer or copy machine is easy and flexible with InterForm. InterForm supports all HP paper types, which ensures that the paper always comes from the correct drawer. For printers that do not support this function it is possible to state a drawer number per paper type in InterForm, and let InterForm control that the right drawer s selected.

Out trays can be selected dynamically from a combination of user profile and form name, ensuring that the printouts always end up in the correct tray.

The InterForm product line ...

InterForm is a complete solution for creating electronic forms on IBM AS/400 and iSeries:

InterForm Security & Digital Signature
Encryption, password-protection and digital signing of PDF-documents on a high level.

InterForm PDF Print
Printing PDF-documents directly from the AS/400.

InterWord
Letter merge and text editing directly on the AS/400.

InterFax
Sending and receiving fax directly on the AS/400.
